

LIVE NEWS PRIVATE APP HANDOFF

Social Publisher App Progress Brief

A concise handoff for another ChatGPT conversation covering what has been built for the Live News Facebook and Instagram publishing system, what is protected, what passed testing, and what should be improved next.

Project

Live News social publishing app for Facebook and Instagram traffic growth.

Current mode

Private, noindex, human-approved, exact-link publishing only.

Last updated

May 10, 2026.

Privacy note

No tokens, private keys, or personal account credentials are included.

Current status: Facebook API publishing works. A Live News Page post was published through the Meta API with an exact public `/stories/...` article URL. The latest build then improved the quality layer so future posts are less robotic and better suited for readers.

1. Product Direction To Preserve

Live News is readability-first, low-clutter, source-respectful, and built to move people from social platforms to exact Live News article pages. The social app should support that direction, not become a separate public product inside the website.

- Brand remains **Live News** with the tagline **Anytime & Anywhere**.
- No ads are added to the website experience.
- No community hub is being built into Live News.
- Every public story and social post must respect attribution and original source links.
- Social posts should use Live News wording and should not copy publisher wording or public comments.

- Posts should point to exact internal story pages, not the homepage.
- Human approval stays required until the system has a proven quality record.

2. What Has Been Built

Story approval

Private dashboard approves source-respectful article pages before they can be posted.

Social drafts

Private generator creates Instagram and Facebook packages from approved Live News stories.

Meta readiness

Private checks confirm app variables, posting switches, permissions, and exact-link rules.

API posting

Facebook API posting works after human approval and exact story URL validation.

Performance memory

Stores aggregate post performance lessons without private user data or copied comments.

Teacher checks

Quality layers block unsafe, generic, copied, or non-source-backed social packages.

Component	Purpose	Important behavior
<code>/admin/stories</code>	Private story approval.	Turns a review-only draft into a public Live News story page only after quality checks pass.
<code>/admin/social</code>	Private social post review.	Shows Facebook and Instagram drafts, caption variants, teacher checks, and API posting buttons.
<code>/admin/meta</code>	Meta readiness dashboard.	Confirms app settings are configured before API posting is attempted.
<code>/admin/performance</code>	Performance memory entry.	Lets editor record aggregate performance lessons from social posts.
<code>lib/meta-publisher.js</code>	Facebook and Instagram API plans.	Requires exact article URL, private token variables, human-reviewed drafts, and no homepage links.
<code>lib/social-intelligence.js</code>	Social writing and teacher brain.	Builds captions, audience angles, hashtags, teacher checks, and safe learning rules.

3. Meta Setup Status

The Meta connection has been set up enough for Facebook API posting to work. Private values are stored in Railway environment variables and must not be shared in ChatGPT prompts or screenshots.

- Meta developer app is connected for the Live News social publishing workflow.
- Facebook Page is connected and API posting succeeded publicly.
- Instagram professional account is connected through Meta Business Suite for future posting work.
- Railway variables are used for app ID, Page ID, Instagram business account ID, Graph version, posting switches, and access token.
- Access token values are private and are intentionally not included here.

Important: keep using placeholders like `YOUR_ADMIN_TOKEN` in docs or ChatGPT. Do not paste real Railway tokens, Meta tokens, browser URLs containing tokens, or personal login details.

4. Publishing Flow

1. Live News collects and organizes source-linked news items.
2. Article agents prepare review-only story drafts.
3. The editor approves a story inside the private Story Approval dashboard.
4. Approval creates a public `/stories/...` page with source attribution.
5. Social Publisher refreshes private Instagram and Facebook draft packages.
6. The editor reviews caption, title framing, hashtags, image URL, and teacher checks.
7. The Facebook API button posts only if the exact article URL is available and Meta readiness passes.
8. After posting, aggregate performance can be recorded in Performance Memory.

5. Safety Layers

The app is intentionally built like a protected system instead of a one-click auto-poster. It publishes only after the story page and social package pass multiple gates.

- **Exact Link Gate:** social posts must use exact Live News story pages, not the homepage.
- **Human Approval Gate:** drafts stay private and review-only before publishing.
- **Source Safety Teacher:** checks attribution and original source links.
- **Human Relevance Teacher:** checks that captions have a real reader angle.
- **Rhythm Variety Teacher:** blocks repeated robotic openings and repeated structures.

- **Platform Fit Teacher:** checks platform-specific caption and media needs.
- **Growth Memory Teacher:** learns from aggregate results, not private data.
- **Meta Publishing Guard:** blocks posting when variables, permissions, or tokens are not ready.

6. Most Recent Quality Upgrade

After the first successful API post, the weakness was not the API. The weakness was the caption quality. The social writing engine has now been upgraded so the API publishes stronger material.

- Facebook captions no longer default to stiff `Top Story: title` wording.
- Captions now lead with one useful, human-readable detail when source-safe data exists.
- Posts include a clearer exact-article call to action: `Read the Live News page:`.
- Hashtags are smaller and more relevant, such as `#LiveNews`, category tags, and topic tags.
- Internal workflow wording is blocked from public captions, including `review-only` and `source packet`.
- Audience pattern scoring was fixed so unrelated patterns do not attach just because they are high priority.
- Approved stories now pass richer context into social drafts: dek, summary, key points, why-it-matters, image fields, and original publisher title.

7. Example Of The Improved Direction

Instead of a stiff API post like this:

`Top Story: Why Paige Bueckers Wings Best Caitlin Clark Fever Matters Now.`

The upgraded generator aims for something closer to this when source data supports it:

Caitlin Clark and Paige Bueckers drew attention in a WNBA matchup between recent No. 1 draft picks.

Source-linked coverage from The Guardian.

Read the Live News page: `https://newsmorenow.com/stories/...`

`#LiveNews`

`#SportsNews`

`#WNBA`

8. Growth Memory Rules

The app should get smarter over time by learning from aggregate signals. It should not become a scraper of people, private messages, random public comments, or copied creator language.

Allowed learning	Blocked learning
Reach, views, likes, comments count, shares, saves, link clicks, profile visits, follows, hides, reports, posting time, category, caption shape, media shape, and exact article clicks.	Private messages, personal profiles, individual identities, private contact details, real access tokens, copied comment text, and unsupported claims from comments.
Aggregate comment patterns such as confusion, useful questions, correction requests, or tone problems.	Copying public comments into captions or treating comments as verified facts.
Public platform best-practice patterns such as clear hooks, relevant hashtags, and original source-linked wording.	Cheap engagement bait, outrage bait, unrelated hashtags, misleading captions, or copied publisher structures.

9. Verification Completed

- `npm test` passed after the latest quality upgrade.
- Facebook API posting succeeded publicly through the Live News Page.
- Meta publishing tests pass with mocked Graph calls.
- Social intelligence tests confirm teacher layers, exact-link checks, safe memory, and platform captions.
- Social publisher tests confirm approved drafts use exact Live News article links.
- Latest pushed commit: `ff4e84f Improve social post quality engine`.

10. Important Files

File	What it controls
<code>lib/social-intelligence.js</code>	Audience patterns, caption variants, hashtag logic, blocked phrases, and teacher checks.
<code>lib/social-publisher.js</code>	Social draft packaging for Facebook and Instagram.
<code>lib/meta-publisher.js</code>	Meta API post planning, validation, error handling, and publishing.
<code>lib/article-agents/approved-stories.js</code>	Approved story enrichment so social drafts have stronger context.
<code>data/social-style-memory.json</code>	Safe learning rules and public-pattern principles.
<code>data/social-performance-memory.json</code>	Aggregate social performance records and lessons.
<code>scripts/check-social-intelligence.js</code>	Regression checks for safe social intelligence behavior.
<code>scripts/check-meta-publishing.js</code>	Regression checks for Meta API publishing guards.

11. Private Admin Links

Use these with the real admin token only in the browser. Do not paste the real token into public tools.

- `https://newsmorenow.com/admin/stories?token=YOUR_ADMIN_TOKEN`
- `https://newsmorenow.com/admin/social?token=YOUR_ADMIN_TOKEN`
- `https://newsmorenow.com/admin/meta?token=YOUR_ADMIN_TOKEN`
- `https://newsmorenow.com/admin/performance?token=YOUR_ADMIN_TOKEN`

12. Next Build Priorities

- 1. Regenerate after deployment:** approve a new story and confirm the social dashboard shows improved captions.
- 2. Improve story drafts:** make approved story pages themselves less generic, because stronger story pages create stronger social posts.
- 3. Instagram image flow:** build or connect durable, properly sized image/card generation for Instagram API publishing.

4. **Performance loop:** after every post, record aggregate metrics and let the Growth Memory Teacher update lessons.
5. **A/B caption review:** keep at least three variants and record which one the editor chose.
6. **Public-interest research later:** add trusted trend/source signals carefully, without copying people or adding unsupported facts.

13. Source Guidance Used

The social quality direction follows Meta's public guidance around content distribution and spam reduction:

- Meta Content Distribution Guidelines: <https://about.fb.com/news/2021/09/content-distribution-guidelines/>
- Meta spammy content update: <https://about.fb.com/news/2025/04/cracking-down-spammy-content-facebook/>

14. Paste-Ready ChatGPT Context

I am building Live News, a readability-first, source-respectful news website with a private social publishing app for Facebook and Instagram. The social app must drive traffic to exact Live News article pages, not the homepage.

Current system:

- Private Story Approval dashboard approves source-respectful Live News story pages.
- Private Social Publisher creates Instagram and Facebook draft packages.
- Meta API posting works for Facebook after human approval and exact /stories/... URL validation.
- Auto-posting is disabled. Human approval is required.
- Railway stores private variables and tokens. Do not ask me to paste tokens into public prompts.
- The system has teacher layers: Source Safety, Human Relevance, Rhythm Variety, Platform Fit, Growth Memory, Human Approval.
- Social posts must include attribution, original source respect, exact Live News article link, and no copied publisher wording.
- Social learning must use aggregate metrics only: link clicks, shares, saves, reach, views, hides, reports, category, caption shape, and posting time.
- Do not learn from or copy private messages, usernames, personal profiles, or exact public comments.

Recent upgrade:

- Facebook captions no longer default to stiff "Top Story: title" wording.
- Captions now start with a useful human-readable detail when safe source data exists.
- Posts include "Read the Live News page:" with exact story URL.
- Hashtags are smaller and relevant, such as #LiveNews, category tags, and topic

tags.

- Internal draft language like "review-only" and "source packet" is blocked from public captions.
- Audience matching is stricter so unrelated high-priority patterns do not attach to the wrong story.

Next goal:

Make Live News social posts feel more human, factual, and attention-worthy while staying source-safe. Improve Instagram image/card generation, record aggregate performance, and keep improving captions through safe performance memory.

Document prepared for project handoff. It intentionally excludes real tokens, personal account details, and private credentials.
